

CPID Macheng New Energy Base Explores Trial “Green Economy” Planting

In order to further explore the scientific application of PV agriculture and make full use of land resources, CPID Macheng New Energy Base is actively carrying out agricultural planting and exploring trial "green economy" under PV panels.

Recently, the base invited experts from Macheng Agricultural and Rural Bureau to the site for planting guidance. “We have planted 200 *mu* of dandelion in here, and 200 *mu* of coffee trees and 200 *mu* of vegetables over there,” said a person of the agricultural company to Mr. Jing Zineng, Member of CPC Leadership Group and Chief Horticulturist of Macheng Agricultural and Rural Bureau, and his fellows. “They are all growing well.” The experts looked carefully in the fields and carried out in-depth communication with the personnel of the agricultural company.

Mr. Jing said that they would actively support the development of green economy in the new energy base, to organically combine PV technology with modern physical agriculture, explore complementary forms according to local conditions, enhance the three-dimensional value-added utilization of land, and achieve a win-win situation for energy development and agricultural production.

The agricultural company will further strengthen the contact with Macheng Agricultural and Rural Bureau, and strive for more policies and technical resources to develop and grow the base's multi-energy complementary economy.
