

China Power (Shangqiu) Thermal Power Ranked First Among Similar Units in the Province for 2026 Priority Power Generation Quotas

On June 25, the Henan Provincial Development and Reform Commission issued the "Notice on Issuing the 2026 Priority Power Generation Plan". The annual priority power generation quota of China Power (Shangqiu) Thermal Power increased by 9% year-over-year, ranking first among similar units in the province and setting a new historical high for the company.

To ensure the successful application of its annual priority power generation, the company began the preparatory work at the start of the year. It closely monitored updates to provincial priority power generation policies and quota approval standards in real time, and transformed policy benefits into operational growth through efficient cross-departmental collaboration and in-depth analysis of the criteria for earning bonus points. As a core power generation hub in eastern Henan and the primary heat source in Shangqiu, the company maintained stable and full-capacity generation during critical supply periods such as the peak demand period in winter, and it also effectively shouldered the heavy responsibility of ensuring the power supply for people's livelihoods through its region-leading heating capacity. In addition, the company has demonstrated its achievements in green and low-carbon development by strictly controlling

procurement and ensuring stable coal quality through scientific blending, while continuously improving the utilization rate of urban reclaimed water. Leveraging its comprehensive strengths in power supply security, public welfare, environmental protection, and lean management, the company has successfully transformed its core competitiveness into bonus points in its application, which allowed it to secure all possible quotas under relevant policies, maximizing its operational benefits.
