

China Power Dabieshan Ranks First Regionally in Renewable Energy Utilization Hours and Revenue per Unit of Capacity in First Half of 2026

According to statistics released on July 10, China Power's Dabieshan Power Company ranked first in Hubei Province in both cumulative utilization hours and revenue per unit of capacity for its renewable energy projects in the first half of 2026, achieving steady improvement in operating performance.

Since the beginning of this year, the company has remained closely attuned to market developments and focused on four core pillars: policy interpretation, market assessment, targeted measures, and coordination between production and sales. It has proactively addressed challenges and responded to market changes through a range of precise initiatives. The company has worked to improve the accuracy of policy interpretation, conducted in-depth assessments of regional policy trends, effectively mitigated policy risks, and captured opportunities arising from favorable policies.

It has fully leveraged its market analysis capabilities, dynamically adjusted trading strategies, and fine-tuned its market positions to maintain the initiative in market-based transactions. The company has also continued to strengthen coordination between production and sales by building a bridge between market demand and production supply, improving internal communication channels, and creating a positive cycle in which production is guided by sales and sales are supported by production. These efforts have kept the operating performance of its renewable energy projects among the best in the region and firmly safeguarded the company's revenue base.
