

China Power Shentou Company Seizes New Policy Opportunities, Generating Over RMB 10 Million in Additional Revenue from Power Exports

On August 5, China Power Shentou Power Generating Company Limited ("China Power Shentou") seized the opportunity presented by the official implementation of the new provincial transmission and distribution tariff policy in the fourth regulatory cycle, and took the initiative to settle power exports via the Yan-Huai DC transmission line in accordance with the latest power transmission and distribution tariff standards, generating over RMB 10 million in additional revenue.

This round of adjustment to power transmission and distribution pricing policy has allowed for greater cost flexibility in the transmission segment, and created favorable conditions for power generation enterprises to optimize the settlement of power exports. Following the release of the policy document, the company immediately established a special working group. It proactively reached out multiple times to key organizations—including the Shanxi Development and Reform Commission, the local power grid company, and the provincial power trading center—to conduct several rounds of consultations and briefings on the pricing rules for power transmitted via the Yan-Huai DC transmission line. Through repeated communication and coordination to standardize the settlement criteria, the company made every effort to ensure that the new power pricing standards would take effect for power transmitted from August through December 2026. By paying close attention to the details of policy implementation, continuously deepening routine communication and collaboration mechanisms between government and enterprises as well as between power grid side and enterprises, and persistently exploring the potential of various business-friendly policies related to power pricing and trading, the company has achieved significant breakthroughs in its production and operations.
